Table 1 Transceivers (most common transceivers are printed in bold) with their transmission rates and maximum network expansion

The LonWorks technology allows to implement distributed automation systems. In this context, intelligent nodes communicate via the LonTalkProtocol®. The neuron chip (3120, 3150 and various enhancements), which accesses a transmission medium via a transceiver and features an I/O circuit for connecting, for example switches, relays, analogue outputs, analogue value measurement systems, is the core of a node (**Figure 1**).

### Transmission media

In addition to the two-wire connection described below, 230 V, optical fibre cable, coaxial cable, LAN and radio transmission is possible.

### Two-wire bus cable used as transmission medium

The transceivers for a two-wire bus cable (e.g. J-Y(ST)Y 2x2x0.8) have different transmission rates (kbit/s) and a different maximum network expansion (cable length in metres) (**Table 1**).

Since the two-wire bus cable can be placed in free space, the devices in the LON building installation are mainly equipped with FTTs (Free Topology Transceivers) and LPT (Link Power

Transceivers) (LPTs are compatible with FTTs at the same bus).

The transceivers in FTT/LPT networks have the core/core and core/earth capacitances shown in **Table 2**. If surge protective devices are installed, their capacitances (core/core and core/earth) must also be considered since the maximum number of transceivers to be used is reduced accordingly (**Table 3**).

### Surges caused by induction loops

When routing the cables, it must be observed that no induction loops are formed. Therefore, the bus and low-voltage cables leading to the bus devices must be routed in close

Transceiver	Capacitance	
	Core / core	Core / earth

## White Paper

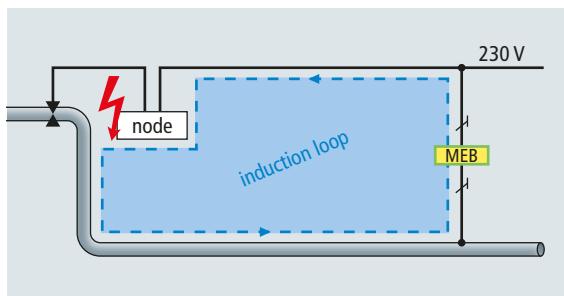

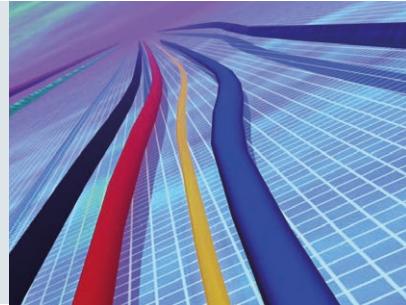

Figure 3 Induction loop caused by a magnetic valve attached to a metallic pipe

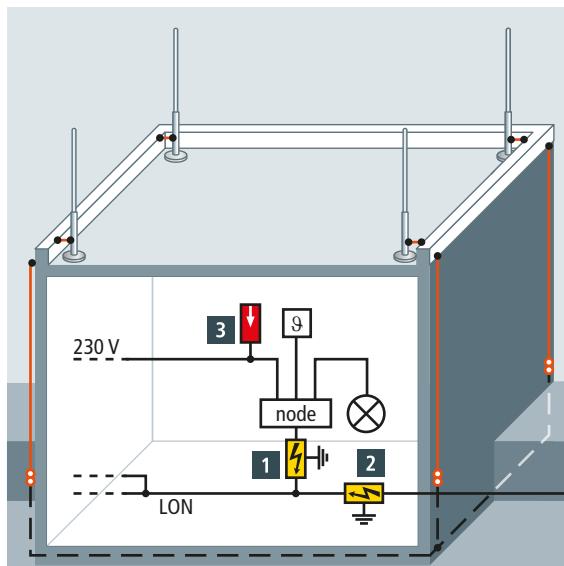

proximity to one another (**Figure 2**). If a J-Y(ST)Y cable has a dielectric strength of 2.5 kV, this cable can be connected

in parallel with a low-voltage cable. However, a distance of 10 mm must be kept after removing the J-Y(ST)Y cable sheath. Loops are also formed if a node is attached to a metallic construction/pipe which is connected to the main earthing busbar (**Figure 3**). Also in this case, it is advisable to route the cables as close as possible to the construction/pipe.

### Surge protection in case of a combination topology

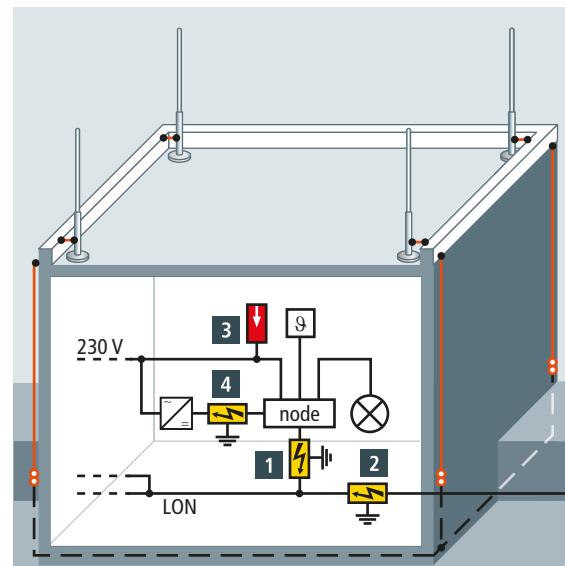

If the inputs/outputs connected to the node are located in close proximity to the node, surge protective devices are not required.

**Figure 4** shows surge protective devices for LPTs which are supplied by means of a two-wire bus cable. **Figure 5** shows surge protective devices for directly supplied FTTs (typically 24 V d.c.) in case of long connecting cables of power supply units.
